1. Trust button (like button), each user can increment the number of likes as much as they want. This is a problem because each user should increment the number of likes by one.

Location: view.html & profile.html

Possible solution: include each user_id whenever the user press the button, and then check if user_id=any id stored then don't increment the number of likes.

2. Slide show can get out of sync via speed and orientation when left playing for too long, or when rapidly clicking through the pictures.

Location: index.html

Possible solution: In javascript part of the html, find a way to reset timer back to 0 when clicking the next slide button

3. Resolution bug on homepage. If your screen has a small resolution, the slideshow will overlap the calendar.

Location: layout.html or index.html

Possible solution: none so far don't really know how to fix

4. On review page, you can change author name to anything

Location: default.py and postreview.html

Possible solution: In db.py make the author name section none writeable

5. On messages page, the to id section, if clicking messages on the navigation bar you can select who ever you want to message, but when clicking send this person a message on the view page we want to only have that person's name on the to id field.

Location: default.py and messages.html

Possible solution: don't use sql forms or find a way to make the to id field not writeable and set the default to the user id of the person you clicked on

6. On the view page, if you have a long description for a item, the description will trail off to oblivion.

Location: view.html

Possible solution: add a div class that sets whitespace to wrapping

7. On the delete page, if you have a long description for a item, the description will trail off to oblivion.

Location: view.html

Possible solution: add a div class that sets whitespace to wrapping
